

## Meets Needs of Service Providers

- Supports Hosted and Federated Models
- Supports Custom Domain Names
- Works Through NATs/Firewalls
- Scales to Millions of Subscribers

## MultiService Enterprise Instant Messaging

### Overview

Secure presence-based, real-time communication applications provide a collaboration environment across geography and enterprises that adds value by:

- Speeding business decision making
- Cutting through communications clutter
- Reducing telephony costs
- Simplifying management of geographically-dispersed workers

Instant Messaging (IM) is the vanguard application of real-time multimedia collaboration in the enterprise. Presence-based voice services and personal video conferencing are high-value natural add-ons.

dynamicsoft MultiService Enterprise Instant Messaging enables the creation of customizable IM service offerings for service providers targeting enterprise users in most any industry segment. Its benefits expand far beyond IM in providing a standards-based presence infrastructure supporting real-time communications among users via IM, voice or video telephony. By incorporating security and logging features critical to the most stringent IM communications environment, MultiService enables service providers to confidently deploy IM as an add-on to their existing information services, or as part of a new suite of real-time multimedia communications applications. In addition, MultiService includes a market-leading application development environment. This enables continuous development of new and differentiated services tailored to users' real-time status and communication needs. The result is higher revenues, increased usage and strengthened subscriber loyalty.

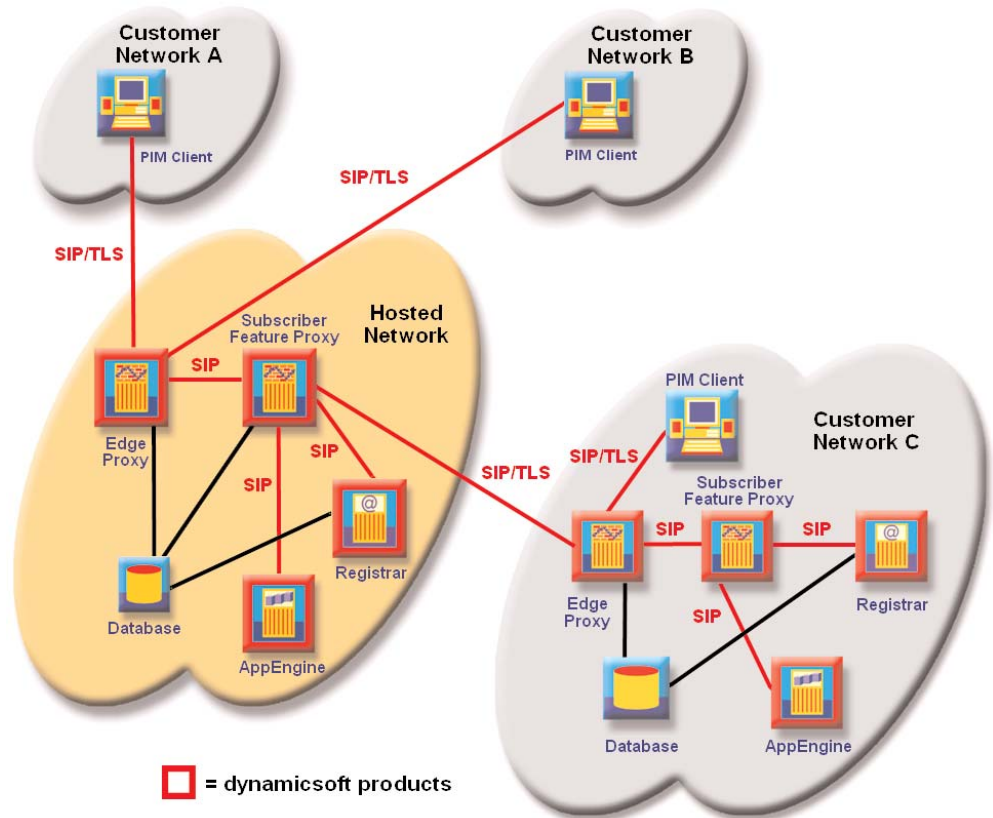

### MultiService Meets the Needs of Secure IM:

- Carrier-grade Presence Infrastructure
- Peer-to-Peer IM
- Group Messaging
- Off-line Message Delivery (In Conjunction with a Partner)
- Message and Presence Information Security
- Federated and Hosted Deployment Models
- Custom Domain Name Support
- Supports Financial Industry Message Logging and Archiving Requirements

## MultiService Value-Added Services Roadmap

- Subscriber-Aware, Presence-Based Applications
- Second-Line Telephony
- Video Conferencing
- Service Creation Environment

## dynamicsoft's Enterprise Instant Messaging Network Architecture Customers A and B Served by Hosted Network, Customer C's Network is Federated

## Presence Integrated Across The Real-Time Communications Spectrum

### Higher Value Services, Lower Costs

While MultiService provides a complete infrastructure solution that meets the most stringent requirements of secure enterprise instant messaging, it provides core application capabilities that enable many high-value services, at reduced overall development, deployment and management costs. Of the many core application capabilities of a MultiService network, its sophisticated presence infrastructure and support for multiple media and endpoint types are the most important. All services become more compelling and increase in value when linked together and invoked via presence information.

In developing MultiService, dynamicsoft leveraged the SIP protocol's inherent flexibility to create a presence infrastructure solution that includes voice, video and web integration capabilities. MultiService thus provides key presence capabilities to all applications and services, such as presence policy management and directory services.

**MultiService increases the value of communication networks far beyond instant messaging. It enables unique and compelling services through the integration of presence into applications that can now leverage multiple media types across many service endpoints.**

The result? MultiService increases the value of communication networks far beyond instant messaging. It enables unique and compelling services through the integration of presence into applications that can now leverage multiple media types across many service endpoints. The following are native capabilities of a MultiService network:

- Support for Presence-Enabled Telephony
- Support for Presence-Enabled Personal Video Conferencing
- Support for Client Devices Supporting Combinations of Presence, IM, Voice and Video Capabilities

Additionally, MultiService allows new subscriber-aware applications to be rapidly created and deployed across the network at minimal expense, while enabling maximum investment reuse. Requirements common to all services are met by a single communication infrastructure. Rich services extending beyond IM can be offered, including:

- Presence-Based Video Conferencing
- Ad-Hoc Conferencing
- Advanced Telephony Apps
- Community of Interest Alerting

## **MultiService Core Network Capabilities**

In addition to providing core application capabilities, MultiService provides core network capabilities that benefit all applications in the MultiService network. This again reduces time-to-market, overall cost and complexity of deploying multiple services. These core MultiService network capabilities include:

- Presence
- IM, Voice and Video
- Broad Range of Supported Endpoints
- Java-Based Application Development Environment
- Scriptable Routing
- Web Integration
- User Authentication and Authorization
- Enterprise and Residential NAT/Firewall Penetration
- Logging
- Network Management
- Network Security
- High Availability
- Scalability
- Client Operating Systems: Windows 98, ME, 2000, XP
- Server Operating Systems: Sun Solaris 8, Windows 2000 Server
- Database: Oracle, Microsoft SQL Server

## Platforms Supported

### Client Operating Systems

- Windows® 98, ME, 2000, XP

### Server Operating Systems

- Sun® Solaris™ 8
- Windows® 2000 Server

### Java Virtual Machine

- Sun JVM™

## Related dynamicsoft Products

- PC Client SDK
- AppEngine
- Subscriber Feature Proxy

## MultiService Enterprise IM Key Components

The functional modules comprising MultiService Secure Instant Messaging are:

- **dynamicsoft PC Client SDK:** A client software development kit supporting presence and instant messaging via the IETF's SIP/SIMPLE protocols. It supports a wide range of Windows OS versions and has integrated NAT/Firewall traversal capabilities.
- **AppEngine:** A carrier-grade development platform for creating profitable converged communications services – integrating voice, video, web, presence, instant messaging and email capabilities – over packet-based wireline and wireless networks. The dynamicsoft AppEngine™ allows in-house and third-party developers to use popular web tools such as Java, HTTP and SIP servlets to deploy applications.
- **Subscriber Feature Proxy:** A network element that combines the capabilities of a subscriber-oriented SIP Proxy Server with the programmable capabilities of the Route Engine Platform. The dynamicsoft Subscriber Feature Proxy™ is the basic building block in the creation of next-generation telephony services.
- **Registration Server:** A solution that combines SIP registrar capabilities with a web-based application to facilitate subscriber self-provisioning and call control. The dynamicsoft Registration Server™ enables the rapid creation and deployment of converged telephony services.

## About dynamicsoft

dynamicsoft software solutions enable carriers and enterprises to build subscriber-aware™ communications networks. These networks drive higher revenue, increase usage and strengthen subscriber loyalty through services tailored to users' real-time communication needs. With innovative solutions ranging from secure enterprise instant messaging to video conferencing, and from cellular presence to 3G infrastructure, dynamicsoft's products transform traditional telephony into efficient, productive and interactive real-time communications. Leveraging acknowledged leadership in wireless and Internet standards bodies, dynamicsoft enables subscriber-aware services today while increasing the long-term value of our customers' networks.
