

Presence – the new dimension to staying in touch

As mobile communication becomes even more personal, presence adds a whole new dimension to staying in touch. Tomorrow's subscribers will know how and when they can reach their friends, even before they make a call.

Already adopted in the Internet, presence is set to be a leading service in the mobile world due to the close association between people and their terminals. With presence, mobile users will be able to create dynamic profiles of their own, including information such as their availability, location, current activity and terminal capabilities. This profile is stored in the network and provides valuable information about the subscriber.

Presence will enable new services as well as enrich existing ones. This will lead to

a richer communication experience for the users. Before making a call, the user can determine whether the other person is available and willing to communicate and by what means. This allows people to control their own communication more effectively. Also when presence information is visually rich in content, users can personalize their appearance: the ability to change the way one looks in the mobile devices of closest contacts will be a very powerful self-expression tool. At the end presence information can be anything that is valuable for the subscribers to know and the publisher is willing to share.

Controlling and updating the presence information

Nokia Presence Server controls the presence subscription and updates the presence information, making presence

services convenient and easy to use. The presence information is exchanged between terminals and servers and further, between servers according to the Open Mobile Alliance Instant Messaging and Presence Services (OMA IMPS) specifications.

The mobile user can subscribe to presence updates to be kept informed at all times about the presence status of another user. Alternatively he or she can do a one-time fetch of the same information. Nokia Presence Server enables the use of terminal based applications such as presence-enhanced contacts, providing means for the mobile subscribers to stay up-to-date with the status of their social network. When a friend's presence status changes, the information is updated dynamically in the background to the terminal client.

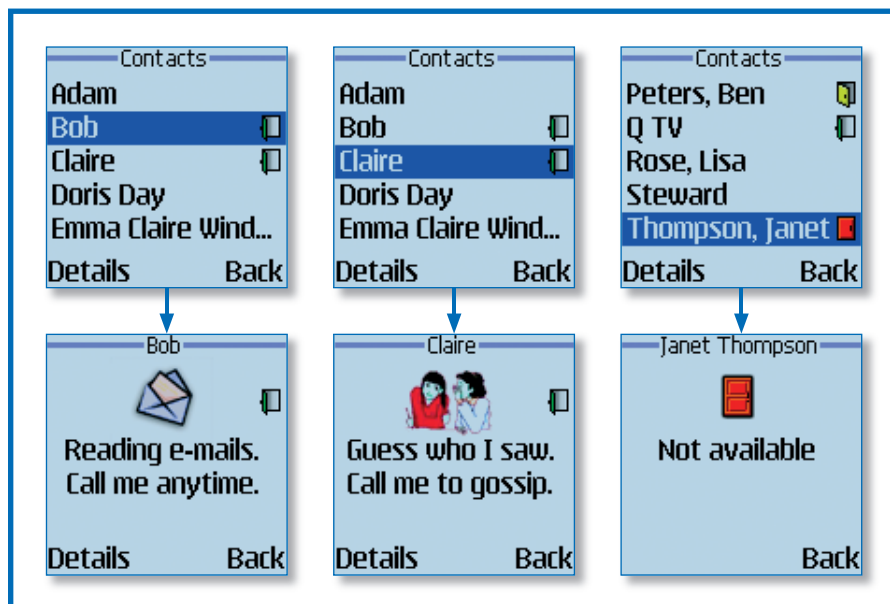

NOKIA
CONNECTING PEOPLE

When looking into a mobile device's phonebook, the intention of the user is to initiate some form of communication with another person. By consulting the presence-enhanced contact list, it is more likely that the communication will be successful. Mobile users can communicate how and when they prefer to be contacted. It is also expected that the availability of presence information will prompt people to communicate more when they see that others are available and willing to talk.

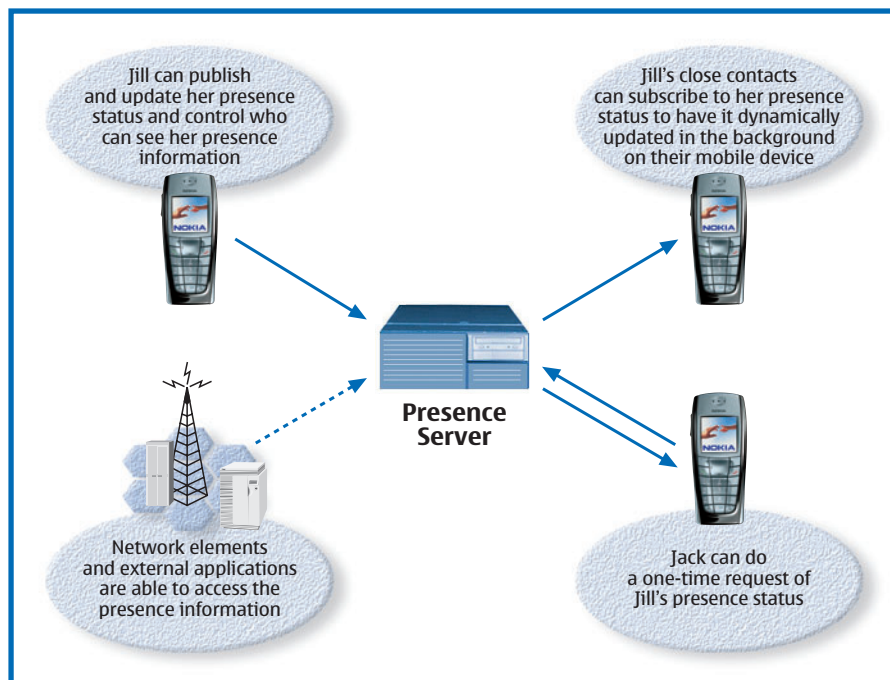

With Nokia Presence Server, a user can determine who can and cannot receive their presence information. The Presence Server is capable of hosting both white and black lists that are managed by the presence owner who can execute a variety of combinations, from limited presence information open to everybody, to all information available to a smaller group of closer contacts.

Presence is a mass-market service with a high growth potential targeting all mobile users. It will enable easier, richer and more discreet communication. One important success factor for mobile presence services to succeed is being able to offer mobile users utility within existing mobile communication. When users benefit from presence information when making a voice call or sending an SMS, the potential user base is unlimited. Another important factor is the usability of terminal presence clients. Viewing others' presence and controlling one's own presence information, must become an easy and natural part of every day mobile phone usage.

The flexible and modular architecture of the Nokia Presence Server supports different business models and revenue streams. Operators will be able to offer presence services to their subscribers, to share more information in their communication. Also operators are growing their assets in having control of their customers' presence information, which can be used to enable and enrich other services.

Keeping track of your contacts with a presence enhanced contact list

Basic functionalities of Nokia Presence Server

Main benefits for operators

- Creates new business opportunities from presence services
- Stimulates other forms of communication
- Protects your investments with open standards and technologies
- Light integration lowers the start-up efforts and costs
- Scalable and available to a large number of presence subscribers
- Easy service deployment

Main benefits for mobile users

- Ability to share your availability and whereabouts
- Able to express yourself, create your own content and share it with others
- Brings you closer to your family and friends by enabling you to share your emotions, feelings and mood
