

Overview

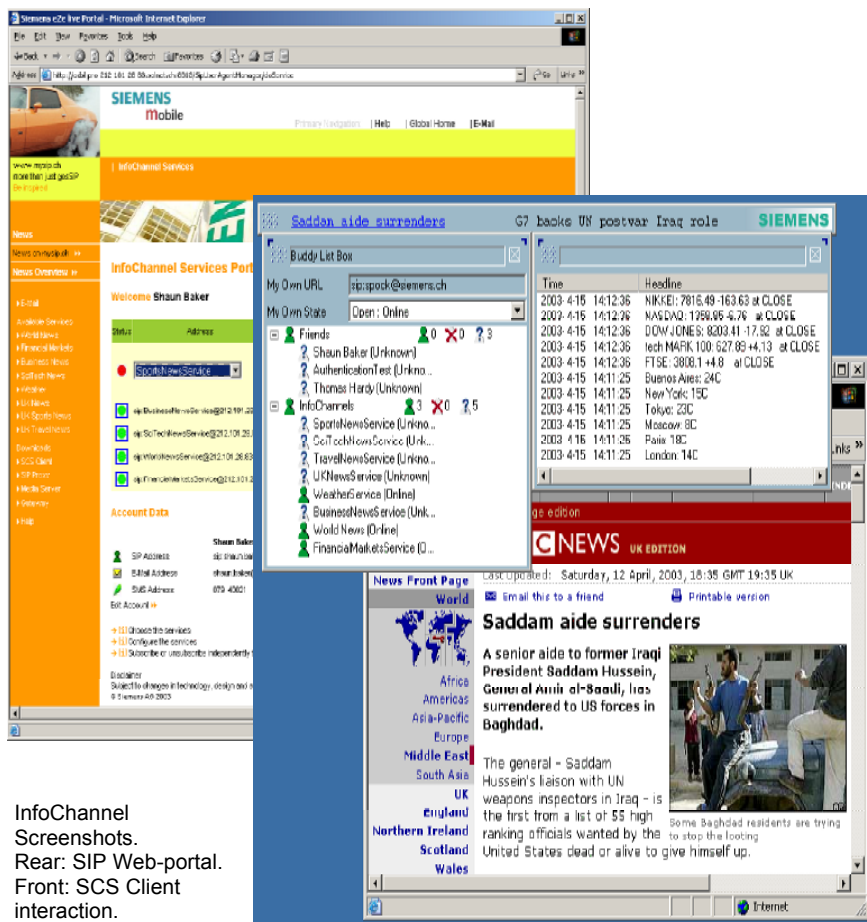

InfoChannels are a platform for 'pushing' unpredictably changing multimedia to end-user consumers, exploiting the opportunities for innovation provided by the Presence Extensions of SIP and the trend for users to be 'always-on'. Primarily aimed at ISPs, InfoChannels provide anyone who has an existing customer base the means to reach it with value-added services 24hours a day, via not only their regular portal, but also by every SIP Client, whether PC, PDA, or cell phone based! Customers get exactly the information they are interested in, precisely when it becomes available. InfoChannel Hosts (e.g. ISPs) get access to the business of multimedia content distribution.

Stating the concept simply: the user subscribes to the InfoChannel Service of interest; the Service has an existing relationship with the Provider of the desired media and becomes a distribution mechanism on its behalf, notifying all interested end-users whenever new information becomes available. The notification is simple: it contains a short description together with one or more URLs. The short description can be used to evaluate the worth of the information; the URLs can be de-referenced to obtain either the web-based detailed information (text, images, downloads, payment mechanism) and/or the streams direct to the actual multimedia (video clips, music, etc.). The choice of what to do remains in the hands of the end-user consumer.

In addition, we offer the possibility to combine InfoChannel Services with other Helper Services, which provide Presence Capability to non-Presence devices, and 'break-out'-type services to non-SIP devices that can become the destination of such notified multimedia via other protocols/networks.

InfoChannel Services

Our InfoChannel Services

...are based on the Ubiquity SIP Application Server (SAS) , and utilize both Java SIP and HTTP Servlet APIs, suitably decoupled to accommodate and operate in any existing SIP infrastructure in terms of Proxies, Registrars, and Presence Servers. The messaging is light, only being generated whenever there is something worth notifying, and then only containing the bare minimum to obtain the information should the end-user consumer so desire. Our ability to accommodate new media, as well as new concepts for services and their combinations is rapid. And with the power of the the Ubiquity SAS we are ready to integrate into 3G architectures.

We provide ...

- Full Runtime environment, with our own Component Based Framework, allowing easy mix-and-match of InfoChannel and Helper Services, and rapid development
- Graphical, fully comprehensive, Service logging and management Facility
- Off-the-Shelf Services and Tailor-Made Services
- Combined SIP and HTTP Presentity
- SIP User Agent Web Portal

... continued on page 2

InfoChannel Services

We provide ... (cont.)

- Registration Service: permitting SIP registration of Services with multiple registrars, under configurable URLs (supporting SIP REGISTER and SIP PUBLISH)
- Discovery Service: Web-Accessed Directory Service of currently on-line and available services, with descriptions and URLs

We support ...

- Siemens Switzerland SCS Client is the showcase Client, providing a fully integrated environment, where all aspects of Subscription, Configuration, Retrieval and Display of InfoServices are amalgamated within the one application
- All SIP Clients, whether PC, PDA or Cell-Phone based
- Non-SIP clients through break-out Services
- SIP Events-capable clients, even when they do not support NOTIFICATION with non-SIP SUBSCRIPTION (e.g. MS Messenger will accept and render in Internet Explorer an InfoChannel notification of new content when delivered via a breakout service as a SIP MESSAGE)

Configuration

- SIP for simple subscription
- HTTP forms for detailed configuration and multiple choice.
- SIP UserAgent Web Portal

Helper Services

- Email Break-out: 'breaks' content out to an email destination, via SMTP
- SMS Break-out: 'breaks' appropriately truncated content out to an SMS Gateway
- Instant Message Break-out: 'breaks' appropriately truncated content out to a CPIM compliant instant message format
- PSTN Breakout: 'breaks' content out to voice destinations in the PSTN, via TTS (as appropriate) over Gateway (Siemens Switzerland InterWorking Unit (IWU))
- POP3 Break-in: allowing email to 'break' into SIP notification or SIP IM.

Information Provider Services

- HTTP retrieval: bulk data retrieval from Information Provider via HTTP
- FTP retrieval: bulk data retrieval from Information Provider via FTP
- POP3 retrieval: bulk data retrieval from Information Provider via POP3
- Customizable Retrieval: tailor-made bulk data retrieval any required protocol

Technical Data

- Java SIP Servlets API
- Java HTTP Servlet API
- Ubiquity SAS
- Session Initiation Protocol, RFC 3261
- INFO Method, RFC 2976
- SIP Specific Event Notification, RFC 3265
- Draft-ietf-sip-content-indirect-mech-02
- SIP Extension for Instant Messaging, RFC 3428
- Draft-olson-simple-publish-02
- InfoChannel Events Package
