### **Abstract**

The purpose of this thesis is to develop the core of accounting software package which is General ledger (GL) module. This software is developed by using Microsoft visual basic 6.0 as main language and SQL server 2000 as DBMS. The Crystal Report ,third party software, is embedded with visual basic program to generate several accounting reports such as financial statement and profit and loss statement.

Designing of this software is base on GL accounting theory and can be used in the real world by accountant. This software is not complete accounting software because is lack of some essential module such as Inventory Sale order but it can separately develop and plug in to this package.
