ABSTRACT

Now the technology is developed increasingly. It's make an idea for building a material , tool and new machine for work such as an industry. It's necessary to have a material , tool , and new machine that have ability to do work replace a people in the hard and dangerous job. So the idea to make a robot or a machine begins and expands. Now the people can make a robot that is as walk as a human and talk with a people ,too. Out side to build a new material. It's important to make a control program for a material for a comfortable and easy work too.

This thesis is one of the ideas to design and make a robot hand and a fitting control program for work. Through the idea of people hand moving to make a robot hand , for using as hand of the people. So it's design the finger move is independent by the motor and wire. It's as sinew of human that make it moving. Then the control program is designed an built in form a gloves for an appropriation of work. Through the gloves have a sensor . It inspect moving of hand which take a success to calculate for control a robot hand for work as move as a human.
