Abstract

Computer plays an important role over our daily life and business. In term of data receiving process, “Mouse” is one of the most important devices to transfer data from user to CPU.

Eye-Controlled Mouse, is an alternative for a computer user who cannot control mouse by hand or leg such as the case of ALS or motor neuron disease. The process of *Eye-Controlled Mouse* is started when web camera catches the movement of an eye. The image will be transformed to be a data by image processing to identify the mouse position on the monitor.

The inspiration of this project is to equalize the working ability between normal and disable by inventing a device to reduce the gap of difference.
